## SME

Charles Wilson

## Abstract

This document describes the process for creation of a set of security requirements to be used across all products.

## Group / Owner

security / Systems Requirements Planner

## Motivation

This document is motivated by the need to have formal processes in place for the creation of security requirements for the development of safety-critical, cyber-physical systems for certification of compliance to standards such as **ISO 21434** and **ISO 26262**.

## Document Status

Approved by certification body

# Overview

In order to create a system with the complexity of an autonomous vehicle, it is necessary to first create a uniformly applicable set of security requirements. This is especially important given that an autonomous vehicle is a safety-critical cyber-physical system.

# Process

The global set of security requirements will be created through the application of gap analysis using a security requirements taxonomy [\[1\]](#). These requirements will then be entered into the requirements tracking system. There they will be tagged based on their **AVCDL** phase of use. They will then be normalized to INCOSE standards using a requirements analysis tool.
