

Secure Settings Select Options Procedure

Revision

Version 3
9/8/25 5:51 PM

SME

Charles Wilson

Abstract

This document describes the procedure used to perform the security option selection activity described in the **AVCDL** ^[1] secondary document **Secure Settings Document** ^[2].

Group / Owner

Security / Security Architect

Motivation

This document is motivated by the need to ensure that the software is built with tools whose selected settings are based on cybersecurity best practices. This is necessary given the nature of safety-critical, cyber-physical systems

Note: Within the context of this document, the terms **security** and **cybersecurity** are used interchangeably. It is presumed that the term **security** is being used in reference to **cybersecurity** and not **physical security**.

Audience

The audience of this document is the cybersecurity practitioner who will be conducting element-specific tool cybersecurity options selection activity.

Completeness of Output

Since the element-specific selection of security options is an as-is analysis, it is critical to ensure that the information gathered is as accurate and complete as possible. As with any cybersecurity activity, it is not the place of the cybersecurity SME to make assumptions on the part of engineering. All information should be sourced from and confirmed by the owner of the element under consideration.

Note: When information is not available for either a given section of the template or parts thereof, this should be noted.

Disposition of Output

Once completed, the generated output should be managed in the organization's document management system (DMS) as a document of record.

Entry Criteria

This document assumes that the reader understands the purpose of cybersecurity-relevant tool settings. Further, that the reader has read and understood the AVCDL **Secure Settings Document** secondary document.

Prerequisites – Security SME

Qualifications

It is required that the cybersecurity SME is both a qualified and trained security architect (shown above on title page as **Owner**) as defined by the **NIST NCWF** role SP-ARC-002 and detailed in section **12.7 Security Architect** of the AVCDL primary document.

Knowledge

It is required that the cybersecurity SME understands the purpose of cybersecurity-relevant tool settings.

Background Information

It is required that the cybersecurity SME has read and understands the AVCDL **Secure Settings Document** ^[2] secondary document. Additionally, that the cybersecurity SME has taken training relevant to this activity.

Prerequisites – Development SME

Qualifications

It is required that the development SME is both a qualified and trained development SME with expertise in the element under consideration in the context of the tool under whose cybersecurity settings are being reviewed.

Note: The specific qualifications and training of development SMEs necessary to assert expertise in providing accurate information regarding the element under consideration is outside the scope of this document.

Note: The development group is responsible for determining and making available the appropriate SME for the analysis of the element under consideration.

Knowledge

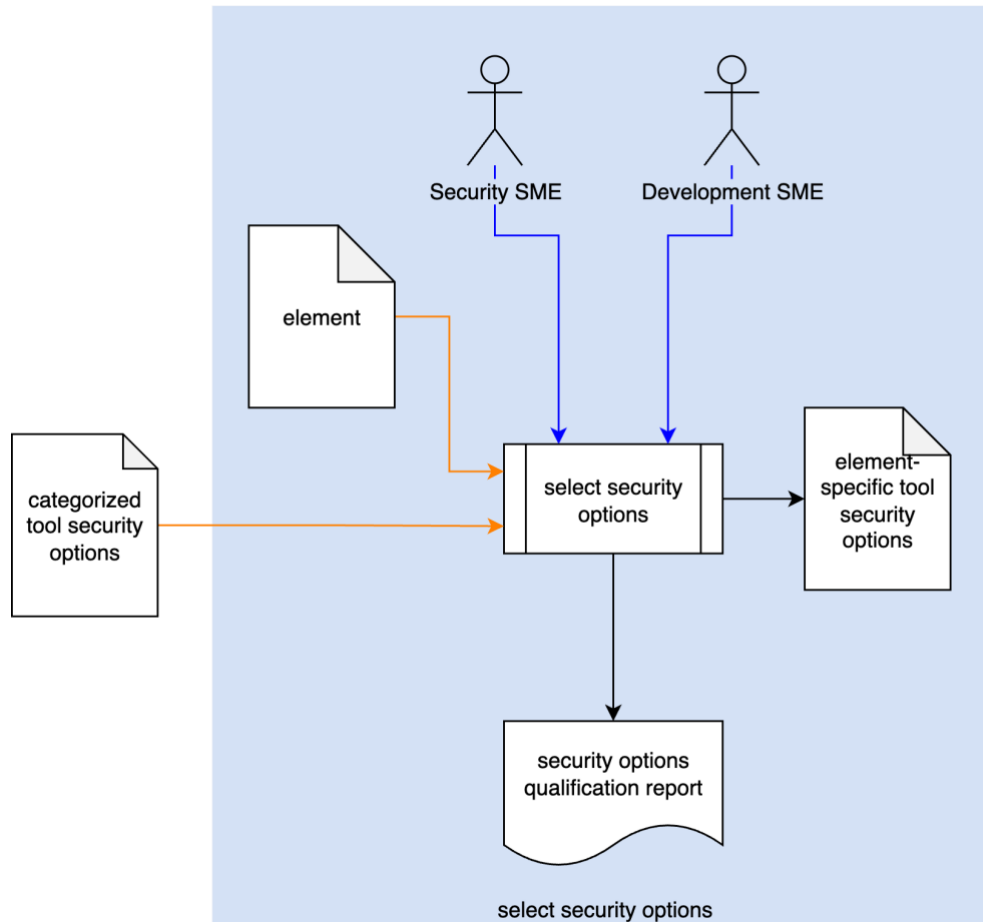

It is required that the development SME have expertise in the element under consideration in the context of the tool under whose cybersecurity settings are being reviewed.

Prerequisites – Input Materials

It is required that the cybersecurity SME acquire all relevant documentation necessary to complete the procedure.

Select Security Options Activity

The workflow diagram for the **select security options** activity of the **Secure Settings Document** is shown below.

Using the **Categorized Tool Security Options** and **Element** under consideration, the Security SME and Development SME select applicable security options to be applied to the **Element**. An **Element-specific Tool Security Options** list is generated. A **Security Options Qualification Report** is generated.

Note: If an option is not used, the justification for not selecting it must be documented.

Methodology

The methodology to be used for selection of element-specific tool cybersecurity options is straightforward. The cybersecurity SME and development SME review each option in turn and either disposition it for inclusion or exclusion. In cases where an option is excluded a justification must be provided by the development SME.

The **Categorized Tool Security Options** list should provide sufficient information for the cybersecurity SME to be able to justify the utility of each option.

Note: Depending on the tool under consideration, the options should be organized by the cybersecurity engineer to focus on those with the greatest cybersecurity impact. This implies a further refinement of the options list beyond that of categorization may be required.

There are various reasons why options may be excluded. These include (but are not limited to):

- Element source not being modifiable
- Option not being applicable to the element (most commonly in static analysis)
- Option use consumes excessive time

Element-specific Tool Options Template

The tool's selected cybersecurity-relevant option information may be documented using the **AVCDL element-specific tool cybersecurity options template** Microsoft Excel workbook [\[3\]](#).

Note: Other forms of documentation are permissible so long as they provide the information laid out in this document.

There are five sheets in the workbook. They are:

- [Cover sheet](#)
- [Revision history](#)
- [Reference documents](#)
- [Option Selection](#)
- [Legend](#)

These will be addressed in turn.

Duplication of Rows in the Various Sheets

When there is the need to add rows to the various sheets of the workbook, be sure to duplicate an existing row. This is because validation checks are attached to some of the cells which also enables the use of dropdown lists.

Cover Sheet

The **cover sheet** of the workbook is shown below:

Element-specific Tool Cybersecurity Options									
Element Name	Element Name								
Element Scope	Element Scope								
Vendor Name	Vendor Name								
Tool Name	Tool Name								
Tool Version	Tool Version								
Tool Platform	Tool Platform								
Tool URL	Tool URL								
Cybersecurity SME	Cybersecurity SME								
Development SME	Development SME								
Date	27-Aug-2000								
Revision	1								

Fields to be completed are shown in **red**.

Element Name

The **element name** is the element to which the tool will be applied.

Element Scope

The scope of the element is left to the discretion of the customer. Examples of element scopes include system, sub-system, component, component software (non-OS), and component OS.

Note: In this context, **the customer** refers to the entity requiring the activity.

Vendor Name

This is the name of the vendor responsible for the element being modeled.

Tool Name

This is the name of the tool whose cybersecurity options are being identified.

Tool Version

This is version number of the tool under consideration.

Tool Platform

This is the platform on which the tool is run.

Tool URL

This is location where the tool can be found.

Cybersecurity SME

This is the cybersecurity subject matter expert creating the option selection list.

Development SME

This is the development subject matter expert providing element-specific tool usage information necessary for the selection of the identified cybersecurity options.

Date

This is the date when the options list was created or updated. The date should be updated whenever the list is updated.

Revision

This is the revision number of the document. The revision number is a monotonic and increasing integer, starting at 1. It should be incremented every time the document is updated.

Revision History

The **revision history** sheet of the workbook is shown below:

Revision History		
Revision	Author	Description
1		initial revision

Revision

The **revision** corresponds to that listed on the cover sheet.

Author

The **author** corresponds to the cybersecurity SME listed on the cover sheet.

Description

This is a brief description of changes made to the document since it was last updated.

Reference Documents

Note: References relevant to the selection of the cybersecurity options should be added to this list.

The **references** sheet of the workbook is shown below:

Reference Documents		
Name	Description	Location

Name

This is the name of the document being referenced.

Description

This is a brief description of the document being referenced.

Note: In cases where the reference material is expressed in the form other than a document (for example, a web page), this should be noted.

Location

This is the location of the document being referenced. It may be a physical location or a URL.

Option Selection

The **option selection** sheet of the workbook is shown below:

Option Selection				
option ID	option	disposition	justification	notes

Option ID

This is the unique ID of the option.

Option

This is the name of the option.

Note: the **option** and **option ID** are sourced from the **Categorized Tool Security Options** list. This may be documented using the **AVCDL tool cybersecurity options template** [\[5\]](#) Microsoft Excel workbook. Additional information can be found in the **Secure Settings – Identify Options Procedure** [\[4\]](#) AVCDL tertiary document.

Disposition

This is the disposition of the option. The option may either be **included** or **excluded**.

Justification

This is the justification for why an option has been **excluded** from use.

Note: This is an optional field. It must be provided only when an option has been **excluded** from use.

Notes

This is a general notes field.

Legend

The **legend** sheet of the workbook is shown below:

disposition
include
exclude

The **legend** sheet information is used to make the completion of the document easier by providing dropdown lists for common values. It also ensures that spelling errors do not creep into the generated material.

Note: The legend sheet should not be edited. If an unlisted value is required, the template should be separately revised.

Exit Criteria

This procedure is considered complete once the generated output has been entered into the organization's DMS as a document of record.

Note: The processes and procedures for entering documents into the DMS, or the updating thereof, are outside the scope of this document.
