

Deprecated Functions Incorporate Scan Procedure

Revision

Version 1
3/26/26 4:03 PM

SME

Charles Wilson

Abstract

This document describes the procedure used to perform the scan incorporation activity described in the **AVCDL** ^[1] secondary document **Currently Used Deprecated Functions Document** ^[2].

Group / Owner

Development / Software Developer

Motivation

This document is motivated by the need to document and justify the use of deprecated functions in the development of software for use within safety-critical, cyber-physical systems.

Note: Within the context of this document, the terms ***security*** and ***cybersecurity*** are used interchangeably. It is presumed that the term ***security*** is being used in reference to ***cybersecurity*** and not ***physical security***.

Audience

The audience of this document is the SME who will be incorporating the deprecated function scanning.

Completeness of Output

Since the incorporation of scanning for deprecated functions is an as-is analysis, it is critical to ensure that the information gathered is as accurate and complete as possible. All information should be sourced from and confirmed by the owner of the element under consideration.

When information is not available for either a given section of the template or parts thereof, this should be noted. Major omissions should be recorded in the cybersecurity risk register.

Disposition of Output

This activity does not create any output managed in the organization's document management system (DMS) as a document of record.

Note: It is recognized that the **updated build file** is stored and managed within the context of the revision control system.

Entry Criteria

This document assumes that the reader understands the purpose of cybersecurity-relevant function deprecation. Further, that the reader has read and understood the **Currently Used Deprecated Functions Document** AVCDL secondary document.

Prerequisites – DevOps SME

Qualifications

It is required that the DevOps SME is both a qualified and trained with expertise in the build system used for the element under consideration in the context of the tooling necessary to perform deprecated function scanning.

Note: The specific qualifications and training necessary to assert specific expertise is outside the scope of this document.

Note: The DevOps group is responsible for determining and making available the appropriate SME for the modifications to the build system needed for the tooling under consideration.

Knowledge

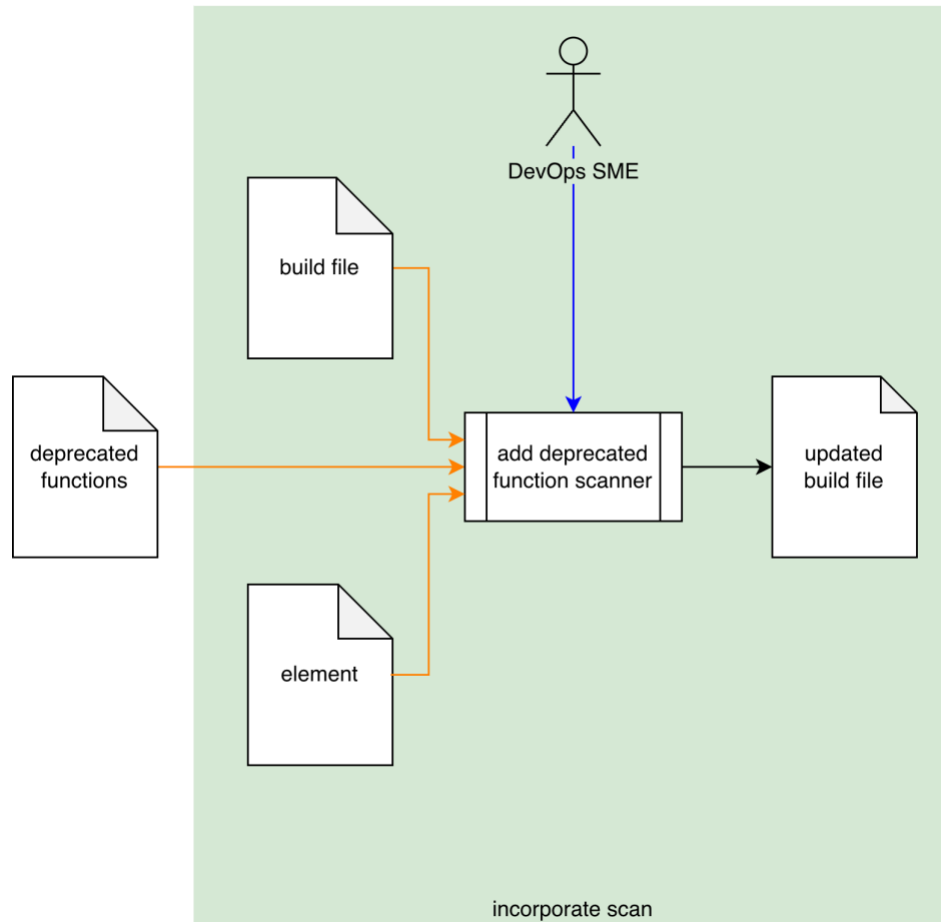

It is required that the DevOps SME have expertise in the build system used for the element under consideration in the context of the tooling necessary to perform deprecated function scanning.

Prerequisites – Input Materials

It is required that the DevOps SME acquire all relevant documentation necessary to complete the procedure.

Incorporate Scan Activity

The workflow diagram for the **incorporate scan** activity of the **deprecated functions** process is shown below.

Using the **Deprecated Functions** list applicable to the **Element**, and **Build File**, the **DevOps SME** adds a function name scanner to the appropriate section of the **Build File**. An **Updated Build File** is created.

Methodology

The methodology to be used for incorporation of deprecated function scanning is straightforward. The DevOps SME modifies the build file for the element under consideration to incorporate a step that scans for the applicable deprecated functions. This function list is the output from the **Identify Functions** activity [\[3\]](#) and may be embodied as detailed in the **AVCDL deprecated function catalog template** [\[4\]](#).

Note: Depending on the modifications made to the build file, there may be a negative impact on build process time. These impacts should be accounted for in any timing limiters applied to the build as a whole.

The specific means by which scanning is accomplished is determined by the organization's tooling. Tooling options include, but are not limited to, static analyzers and shell scripts.

Scanning Tool Capabilities

The scanning tooling should minimally report the location of the deprecated functions from the provided list. If possible, references to the source of the deprecation, and recommended replacement should be provided.

Exit Criteria

This procedure is considered complete once the **updated build file** has been created and validated.

Note: It is recognized that the **updated build file** is stored and managed within the context of the revision control system.
